

**DEPARTMENT
OF
COMPUTERSCIENCE AND
ENGINEERING**

**OPERATING SYSTEMS (Integrated)
LABORATORY MANUAL**

Year : 2023-2024
Course Code : P21CS504
Semester : V
Branch : CSE

1. PROGRAM OUTCOMES:

B.E- PROGRAM OUTCOMES (POS)	
PO-1	Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems(Engineering knowledge).
PO-2	Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences (Problem analysis).
PO-3	Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations (Design/development of solutions).
PO-4	Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions (Conduct investigations of complex problems).
PO-5	Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations (Modern tool usage).
PO-6	Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice (The engineer and society).
PO-7	Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development (Environment and sustainability).
PO-8	Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice (Ethics).
PO-9	Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings (Individual and team work).
PO-10	Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions (Communication).
PO-11	Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multi disciplinary environments (Project management and finance).
PO-12	Recognize the need for, and have the preparation and ability to engage in independent and Life-long learning in the broadest context of technological change (Life-long learning).

2.PROGRAM SPECIFIC OUTCOMES

PSO 1	Ability to apply problem solving skills in developing solutions through fundamentals of Computer Science and Engineering.
PSO 2	Ability to apply Analytical Skills in the field of Data Processing Systems.
PSO 3	Ability to design and develop applications through Software Engineering methodologies and Networking Principles.

Course Outcomes:

Course Outcomes : On completion of this course, students are able to:	
CO 1	Understand the structure of an operating system and various concepts related to it.
CO 2	Demonstrate various operating system operations.
CO 3	Apply suitable techniques for management of different resources.
CO4	Implement various algorithm related to operating system concepts.

3. ATTAINMENT OF PROGRAM OUTCOMES AND PROGRAM SPECIFIC

OUTCOMES:

Sl.No	Experiment	Program Outcome Attained	Program Specific Outcomes Attained
Week-1	Write a program to read data from the standard input device and write it on the screen(using read()/write() system calls)	1,2,3,4,5	1
	Write a program to read data from the standard input device and write it on the screen(using read()/write() system calls)		
Week-2	Program to implement IPC using shared memory	1,2,3,4,5	1
Week-3	Implement the Producer & consumer Problem (Semaphore)	1,2,3,4,5	1
Week-4	Implement the solution to dining philosopher's problem using monitors.	1,2,3,4,5	1
Week-5	Implement the FCFS CPU Scheduling Algorithms	1,2,3,4,5	1
Week-6	Implement Bankers Algorithm for Deadlock Avoidance	1,2,3,4,5	1
Week-7	Implement the following Memory Allocation Methods for fixed partition a) First Fit b) Worst Fit	1,2,3,4,5	1
Week-8	Implement the following Disk Scheduling Algorithms: a) SSTF Scheduling	1,2,3,4,5	1
Week-9	Implement the following Disk Scheduling Algorithms: b) SCAN Scheduling	1,2,3,4,5	1
Week-10	Implement the following File Allocation Strategies a) Sequential File Allocation Strategies	1,2,3,4,5	1
Week-11	Implement the following File Allocation Strategies b) Indexed File Allocation Strategies	1,2,3,4,5	1

OF PROGRAMOUTCOMES:

[illegible]

5.SYLLABUS:

OPERATING SYSTEMS (INTEGRATED) [As per Choice Based Credit System(CBCS) &OBE Scheme] SEMESTER –V			
Course Code:	P21CS504	Credits:	04
Teaching Hours/Week(L:T:P):	3:0:2	CIE Marks:	50
Total Theory Teaching Hours:	40	SEE Marks:	50
Total Laboratory Hours:	24		
Course Learning Objectives: This course will enable the students to: <ul style="list-style-type: none"> • Understand the basic functionalities of Operating System, Process and Threads. • Analyze the usage of different Process and Disk scheduling • Understand the implementation of memory management and virtual memory. • Analyze the structure and organization of the file system 			
UNIT – I			8 Hours
Introduction to operating systems, System structures: What operating systems do; Computer System organization; Computer System architecture; Operating System structure; Operating System operations. Operating System Structures: Operating System Services, System calls; Types of system calls; System programs; Operating System structure Process Management: Process: Process concept; Process scheduling; Operations on processes; Inter process communication			
Self-study component:	Operating System Debugging; Operating System generation.		
Practical topics:(4Hours)	1. Write a program to read data from the standard input device and write it on the screen(using read()/write() system calls) 2. Write a program to print 10 characters starting from the 10th character from a file(lseek() system call) 3. Write a program to implement IPC using shared memory		
UNIT – II			8 Hours
Threads: Overview; Multithreading models; Thread Libraries; Threading issues Process Synchronization: Background, The critical section problem; Peterson's solution; Semaphores; Classical problems of synchronization; Monitors.			
Self-study component:	Implicit threading, Synchronization hardware, mutex locks		
Practical Topics:(6 Hours)	1. Implement the Producer & consumer Problem (Semaphore) 2. Implement the solution to dining philosopher's problem using monitors.		
UNIT – III			8

		Hours
CPU Scheduling: Basic concepts; Scheduling Criteria; Scheduling Algorithms; Multiple-processor scheduling; Deadlocks: System model; Deadlock characterization; Methods for handling deadlocks; Deadlock prevention; Deadlock avoidance; Deadlock detection.		
Self-study component:	Thread scheduling, Recovery from deadlock	
Practical Topics:(4Hours)	1. Implement the FCFS CPU Scheduling Algorithms 2. Implement Bankers Algorithm for Deadlock Avoidance	
UNIT – IV		8 Hours
Memory Management: Main Memory: Background, Swapping; Contiguous Memory allocation; Segmentation; Paging; Virtual Memory: Background; Demand paging; Copy-on-write; Page replacement; Allocation of frames; Thrashing.		
Self-study component:	Structure of page table,I/O Interlock and Page Locking	
Practical Topics: (6Hours)	1. Implement the following Memory Allocation Methods for fixed partition a) First Fit b) Worst Fit 2.Implement the following Page Replacement Algorithms a) FIFO b) LRU	
UNIT – V		8 Hours
Storage Management: Mass storage structures: Overview of mass storage structure, Disk structure; Disk scheduling; File System Interface: File concept; Access methods; Directory structure File System Implementation: File system structure; Directory implementation; Allocation methods;		
Self-study component:	Disk Attachment , RAID structure, File system implementation;	
Practical Topics: (4Hours)	1.Implement the following Disk Scheduling Algorithms: b) SSTF Scheduling b) SCAN Scheduling 2.Implement the following File Allocation Strategies a) Sequential b) Indexed	

Program 1:

Write a program to read data from the standard input device and write it on the screen(using read()/write() system calls)

write()/read() system call

read() and write() system calls are used to read and write data respectively to a file descriptor. To understand the concept of write ()/read() system calls let us first start with write() system call.

write()

write() system call is used to write to a file descriptor. In other words **write()** can be used to write to any file (all hardware are also referred as file in Linux) in the system but rather than specifying the file name, you need to specify its file descriptor.

Syntax:

```
#include<unistd.h>

ssize_t write (int fd, const void *buf,size_t count);
```

The first parameter (fd) is the file descriptor where the file is to be written. The data that is to be written is specified in the second parameter. Finally, the third parameter is the total bytes that are to be written.

read()

The use of **read()** system call is to read from a file descriptor. The working is same as write(), the only difference is **read()** will read the data from file pointed to by file descriptor.

Syntax:

```
#include<unistd.h>

ssize_t read(int fd,const void *buf,size_t count);
```

The first parameter is the file descriptor. The second parameter is the buffer where the read data will be saved. Lastly, the third parameter is the number of bytes that is to be read.

Program:

```
#include<unistd.h>

int main()
{
    int nread;
    char buff[20];
    nread=read(0,buff,10);//read 10 bytes from standard input device(keyboard) and store it
                           in buffer(buff)
    write (1,buff,nread);//print 10 bytes from the buffer on the screen
}
```

Commands:

```
cc filename.c
./a.out
```

Pesce mandya

Pesce mandya

Program 2:

Write a program to print 10 characters starting from the 10th character from a file(lseek() system call)

lseek() system call repositions the read/write file offset i.e., it changes the positions of the read/write pointer within the file. In every file any read or write operations happen at the position pointed to by the pointer. lseek () system call helps us to manage the position of this pointer within a file. e.g., let's suppose the content of a file F1 is "1234567890" but you want the content to be "12345hello". You simply can't open the file and write "hello" because if you do so then "hello" will be written in the very beginning of the file. This means you need to reposition the pointer after '5' and then start writing "hello". lseek () will help to reposition the pointer and write () will be used to write "hello"

Syntax:

```
#include<sys/types.h>
#include<unistd.h>
off_t lseek (int fd,off_t offset,int whence);
```

The first parameter is the file descriptor of the file, which you can get using open () system call.

The second parameter specifies how much the pointer is to be moved.

The third parameter is the reference point of the movement i.e., beginning of file(SEEK_SET),current position(SEEK_CUR) of pointer or end of file(SEEK_END).

Examples:

- lseek(fd,5,SEEK_SET) – this moves the pointer 5 positions ahead starting from the beginning of the file
- lseek(fd,5,SEEK_CUR) – this moves the pointer 5 positions ahead from the current position in the file
- lseek(fd,-5,SEEK_CUR) – this moves the pointer 5 positions back from the current position in the file

- lseek(fd,-5,SEEK_END) -> this moves the pointer 5 positions back from the end of the file
- On success, lseek() returns the position of the pointer within the file as measured in bytes from the beginning of the file. But, on failure, it returns -1.

Program:

//Let the contents of the file F1 be “1234567890abcdefghijxxxxxxxx”. This means we want the output to be “abcdefghij”.

//Note: the first character ‘1’ is at 0th position

```
#include<unistd.h>
```

```
#include<fcntl.h>
```

```
#include<sys/types.h>
```

```
#include<sys/stat.h>
```

```
#include<stdio.h>
```

```
int main()
```

```
{
```

```
int n,f,f1;
```

```
char buff[10];
```

```
f=open("seeking",O_RDWR);
```

```
f1=lseek(f,10,SEEK_SET);
```

```
printf("Pointer is at %d position\n",f1);
```

```
read(f,buff,10);
```

```
write(1,buff,10);
```

```
}
```

Program 3:

Write a program to implement IPC using shared memory.

Inter Process Communication through shared memory is a concept where two or more process can access the common memory and communication is done via this shared memory where changes made by one process can be viewed by another process.

The problem with pipes, fifo and message queue – is that for two process to exchange information, the information has to go through the kernel.

- Server reads from the input file.
- The server writes this data in a message using either a pipe, fifo or message queue.
- The client reads the data from the IPC channel, again requiring the data to be copied from kernel's IPC buffer to the client's buffer.
- Finally the data is copied from the client's buffer.

A total of four copies of data are required (2 read and 2 write). So, shared memory provides a way by letting two or more processes share a memory segment. With Shared Memory the data is only copied twice – from input file into shared memory and from shared memory to the output file.

SYSTEM CALLS USED ARE:

ftok(): is use to generate a unique key.

shmget(): `int shmget(key_t,size_tsize,intshmflg);`

upon successful completion, shmget() returns an identifier for the shared memory segment.

shmat(): Before you can use a shared memory segment, you have to attach yourself to it using shmat().

`void *shmat(int shmid ,void *shmaddr ,int shmflg);`

shmid is shared memory id.

shmaddr specifies specific address to use but we should set it to zero and OS will automatically choose the address.

shmdt(): When you're done with the shared memory segment, your program should detach itself from it using shmdt(). `int shmdt(void *shmaddr);`

shmctl(): when you detach from shared memory, it is not destroyed. So, to destroy shmctl() is used.

```
shmctl(int shmid,IPC_RMID,NULL);
```

Shared Memory for Writer Process

```
#include<stdio.h>
#include<stdlib.h>
#include<unistd.h>
#include<sys/shm.h>
#include<string.h>

int main()
{
    int i;
    void *shared_memory;
    char buff[100];
    int shmid;
    shmid=shmget((key_t)2345, 1024, 0666|IPC_CREAT);
        //creates shared memory segment with key 2345, having size 1024 bytes. IPC_CREAT
        //is used to create the shared segment if it does not exist. 0666 are the permissions on the
        //shared segment.
    printf("Key of shared memory is %d\n",shmid);
    shared_memory=shmat(shmid,NULL,0); //process attached to shared memory segment
    printf("Process attached at %p\n",shared_memory);
        //this prints the address where th segment is attached with this process
    printf("Enter some data to write to shared memory\n");
    read(0,buff,100); //get some input from user
    strcpy(shared_memory,buff); //data written to shared memory
    printf("You wrote : %s\n",(char *)shared_memory);
}
```

How it works?

shmget() function creates a segment with key 2345, size 1024 bytes and read and write permissions for all users. It returns the identifier of the segment which gets store in shmid. This identifier is used in shmat() to attach the shared segment to the address space of the process. NULL in shmat() means that the OS will itself attach the shared segment at a

suitable address of this process. Then some data is read from the user using read() system call and it is finally written to the shared segment using strcpy() function.

Output:

Key of shared memory is 0

Process attached at x7ffe04fb000

Enter some data to write to shared memory

Hello World

You wrote: Hello World

Shared Memory for Reader Process

```
#include<stdio.h>
#include<stdlib.h>
#include<unistd.h>
#include<sys/shm.h>
#include<string.h>
int main()
{
int i;
void *shared_memory;
char buff[100];
int shmid;
shmid=shmget((key_t)2345, 1024, 0666);
printf("Key of shared memory is %d\n",shmid);
shared_memory=shmat(shmid,NULL,0); //process attached to shared memory segment
printf("Process attached at %p\n",shared_memory);
printf("Data read from shared memory is : %s\n",(char *)shared_memory);
}
```

How it works?

shmget () here generates the identifier of the same segment as created in writer process. The same key value must be given. The only change is, do not write IPC_CREAT as the shared memory segment is already created. Next, shmat () attaches the shared segment to the current process. After that, the data is printed from the shared segment. The output, we obtain is the same data that is written while executing the Writer process.

Output

Key of Shared memory is 0

Process attached at 0x7f76b4292999

Data read from shared memory is: Hello World

Program 4:**Implement the Producer & consumer Problem (Semaphore)****Description:**

Producer consumer problem is a synchronization problem. There is a fixed size buffer where producer produces items and that is consumed by the consumer process. One solution to the producer-consumer problem uses shared memory. To allow producer and consumer processes to run concurrently, there must be available a buffer of items that can be filled by the producer and emptied by the consumer. This buffer will reside in a region of memory that is shared by the producer and consumer processes. The producer and consumer must be synchronized, so that the consumer does not try to consume an item that has not yet been produced.

```
#include<stdio.h>

void main()
{
    int buffer[10], bufsize, in, out, produce, consume, choice=0;
    in = 0;
    out = 0;
    bufsize = 10;
    while(choice !=3)
    {
        printf("\n 1. Produce \t 2. Consume \t 3. Exit ");
        printf("\n Enter your choice: ");
        scanf("%d", &choice);
        switch(choice)
        {
            case 1:
                if((in+1)%bufsize==out)
                    printf("\n Buffer is Full");
```

```
        else
        {
            printf("\n Enter the value: ");
            scanf("%d", &produce);
            buffer[in] = produce;
            in = (in+1)%bufsize;
        }
        break;
case 2:
    if(in == out)
        printf("\n Buffer is Empty");
    else
    {
        consume = buffer[out];
        printf("\n The consumed value is %d", consume);
        out = (out+1)%bufsize;
    }
    break;
}
}
```

Program 5:**Implement the solution to dining philosopher's problem using monitors.****Description:**

The dining – philosophers problem is considered a classic synchronization problem because it is an example of a large class of concurrency – control problems. It is a simple presentation of the need to allocate several resources among several processes in a deadlock-free and starvation free manner.

Consider five philosophers who spend their lives thinking and eating. The philosophers share a circular table surrounded by five chairs, each belonging to one philosopher. In the centre of the table is a bowl of rice, and the table is laid with five single chopsticks. When a philosopher thinks, she does not interact with her colleagues. From time to time, a philosopher gets hungry and tries to pick up the two chopsticks that are closest to her (the chopsticks that are between her and her left and right neighbours). A philosopher may pick up only one chopstick at a time. Obviously, she cannot pick up a chopstick that is already in the hand of a neighbour. When a hungry philosopher has both her chopsticks at the same time, she eats without releasing her chopsticks. When she is finished eating, she puts down both of her chopsticks and starts thinking again. The dining-philosophers problem may lead to a deadlock situation and hence some rules have to be framed to avoid the occurrence of deadlock.

ALGORITHM:

Step 1: Start the program.

Step 2: Define the number of philosophers.

Step 3: Declare one thread per philosopher.

Step 4: Declare one chop sticks per philosopher.

Step 5: When a philosopher is hungry.

- i. See if chopsticks on both sides are free.
- ii. Acquire both chopsticks or.
- iii. Eat.
- iv. restore the chopsticks.
- v. If chopsticks aren't free.

Step 6: Wait till they are available.

Step 7: Stop the program.

PROGRAM:

```
#include<stdio.h>
#include<stdlib.h>
int one();
int two() ;
int tph, philname[20], status[20], howhung, hu[20], cho;
int main()
{
    int i;
    printf("\n\nDINING PHILOSOPHER PROBLEM");
    printf("\nEnter the total no. of philosophers: ");
    scanf("%d",&tph);
    for(i=0;i<tph;i++)
    {
        philname[i] = (i+1); status[i]=1;
    }
    printf("How many are hungry : ");
    scanf("%d", &howhung);
    if(howhung==tph)
    {
        printf("\nAll are hungry..\nDead lock stage will occur");
        printf("\nExiting..");
    }
    else
    {
        for(i=0;i<howhung;i++)
        {
            printf("Enter philosopher %d position: ",(i+1));
            scanf("%d", &hu[i]); status[hu[i]]=2;
        }
    }
}
```

```
do{
    printf("1.One can eat at a time\t2.Two can eat at a time\t3.Exit\nEnter your choice:");
    scanf("%d", &cho);
    switch(cho)
    {
        case 1:
            one();
            break;
        case 2:
            two();
            break;
        case 3:
            exit(0);
        default:
            printf("\nInvalid option..");
    }
}
while(1);
}
```

```
int one()
{
    int pos=0, x, i;
    printf("\nAllow one philosopher to eat at any time\n");
    for(i=0;i<howhung; i++, pos++)
    { printf("\nP %d is granted to eat", philname[hu[pos]]);
      for(x=pos;x<howhung;x++)
      printf("\nP %d is waiting", philname[hu[x]]);
    }
}
```

```

int two()
{
int i, j, s=0, t, r, x;
printf("\n Allow two philosophers to eat at same time\n");
for(i=0;i<howhung;i++)
{
for(j=i+1;j<howhung;j++)
{
if(abs(hu[i]-hu[j])>=1&& abs(hu[i]-hu[j])!=4)
{
printf("\n\ncombination %d \n", (s+1));
t=hu[i];
r=hu[j];
s++;
printf("\nP %d and P %d are granted to eat", philname[hu[i]], philname[hu[j]]);
for(x=0;x<howhung;x++)
{
if((hu[x]!=t)&&(hu[x]!=r))
printf("\nP %d is waiting", philname[hu[x]]);
}
}
}
}
}

```

Program 7:**Implement Bankers Algorithm for Deadlock Avoidance****DESCRIPTION**

In a multiprogramming environment, several processes may compete for a finite number of resources. A process requests resources; if the resources are not available at that time, the process enters a waiting state. Sometimes, a waiting process is never again able to change state, because the resources it has requested are held by other waiting processes. This situation is called a deadlock. Deadlock avoidance is one of the techniques for handling deadlocks. This approach requires that the operating system be given in advance additional information concerning which resources a process will request and use during its lifetime. With this additional knowledge, it can decide for each request whether or not the process should wait. To decide whether the current request can be satisfied or must be delayed, the system must consider the resources currently available, the resources currently allocated to each process, and the future requests and releases of each process. Banker's algorithm is a deadlock avoidance algorithm that is applicable to a system with multiple instances of each resource type.

```
#include<stdio.h>
#include<conio.h>
int max[100][100];
int alloc[100][100];
int need[100][100];
int avail[100];
int n,r;
void input();
void show();
void cal();
int main()
{
    int i,j;
    printf("***** Banker's Algorithm *****\n");
    input();
```

```

show();
cal();
getch();
return 0;
}
void input()
{
int i,j;
printf("Enter the no of Processes\t");
scanf("%d",&n);
printf("Enter the no of resources instances\t");
scanf("%d",&r);
printf("Enter the Max Matrix\n");
for(i=0;i<n;i++)
{
for(j=0;j<r;j++)
{
scanf("%d",&max[i][j]);
}
}
printf("Enter the Allocation Matrix\n");
for(i=0;i<n;i++)
{
for(j=0;j<r;j++)
{
scanf("%d",&alloc[i][j]);
}
}
printf("Enter the available Resources\n");
for(j=0;j<r;j++)
{
scanf("%d",&avail[j]);
}
}

```

```

void show()
{
    int i,j;
    printf("Process\t Allocation\t Max\t Available\t");
    for(i=0;i<n;i++)
    {
        printf("\nP%d\t ",i+1);
        for(j=0;j<r;j++)
        {
            printf("%d ",alloc[i][j]);
        }
        printf("\t\t");
        for(j=0;j<r;j++)
        {
            printf("%d ",max[i][j]);
        }
        printf("\t\t");
        if(i==0)
        {
            for(j=0;j<r;j++)
            printf("%d ",avail[j]);
        }
        printf("\t\t");
    }
    printf("\n");
}

```

```

void cal()
{
    int finish[100],temp,need[100][100],flag=1,k,c1=0;
    int safe[100];
    int i,j;
    for(i=0;i<n;i++)

```

```

    {
        finish[i]=0;
    }
//find need matrix
for(i=0;i<n;i++)
    {
        for(j=0;j<r;j++)
            {
                need[i][j]=max[i][j]-alloc[i][j];
            }
    }
printf("\n");
//print need matrix
printf("----Need Matrix-----\n");
for(i=0;i<n;i++)
    {
        for(j=0;j<r;j++)
            {
                printf("%d  ",need[i][j]);
            }
        printf("\n");
    }
printf("\n");
while(flag)
{

Program 8:**Implement the following Memory Allocation Methods for fixed partition**

- a) First Fit b) Worst Fit**

One of the simplest methods for memory allocation is to divide memory into several fixed-sized partitions. Each partition may contain exactly one process. In this multiple-partition method, when a partition is free, a process is selected from the input queue and is loaded into the free partition. When the process terminates, the partition becomes available for another process. The operating system keeps a table indicating which parts of memory are available and which are occupied. Finally, when a process arrives and needs memory, a memory section large enough for this process is provided. When it is time to load or swap a process into main memory, and if there is more than one free block of memory of sufficient size, then the operating system must decide which free block to allocate. Best-fit strategy chooses the block that is closest in size to the request. First-fit chooses the first available block that is large enough. Worst-fit chooses the largest available block.

A. First Fit

```
#include<stdio.h>
#include<conio.h>
#define max 25
void main()
{
int frag[max],b[max],f[max],i,j,nb,nf,temp;
static int bf[max],ff[max];
clrscr();
printf("\n\tMemory Management Scheme - First Fit");
printf("\nEnter the number of blocks:");
scanf("%d",&nb);
printf("Enter the number of files:");
scanf("%d",&nf);
printf("\nEnter the size of the blocks:-\n");
for(i=1;i<=nb;i++)
```

```

    {
        printf("Block %d:",i); scanf("%d",&b[i]);
    }
printf("Enter the size of the files :-\n");
    for(i=1;i<=nf;i++)
    {
        printf("File %d:",i);
        scanf("%d",&f[i]);
    }
for(i=1;i<=nf;i++)
    {
        for(j=1;j<=nb;j++)
        {
            if(bf[j]!=1)
            {
                temp=b[j]-f[i];
                if(temp>=0)
                {
                    ff[i]=j;
                    break;
                }
            }
        }
    }
frag[i]=temp;
bf[ff[i]]=1;
}
printf("\nFile_no:\tFile_size :\tBlock_no:\tBlock_size:\tFragement");
for(i=1;i<=nf;i++)
    printf("\n%d\t%d\t%d\t%d\t%d",i,f[i],ff[i],b[ff[i]],frag[i]);
getch();
}

Program 9:**Implement the following Page Replacement Algorithms****a) FIFO b) LRU****DESCRIPTION :**

Page replacement is basic to demand paging. It completes the separation between logical memory and physical memory. With this mechanism, an enormous virtual memory can be provided for programmers on a smaller physical memory. There are many different page-replacement algorithms. Every operating system probably has its own replacement scheme. A FIFO replacement algorithm associates with each page the time when that page was brought into memory. When a page must be replaced, the oldest page is chosen. If the recent past is used as an approximation of the near future, then the page that has not been used for the longest period of time can be replaced. This approach is the Least Recently Used (LRU) algorithm. LRU replacement associates with each page the time of that page's last use. When a page must be replaced, LRU chooses the page that has not been used for the longest period of time. Least frequently used (LFU) page-replacement algorithm requires that the page with the smallest count be replaced. The reason for this selection is that an actively used page should have a large reference count.

A. FIFO

```
#include<stdio.h>
#include<conio.h>
main()
{
    int i, j, k, f, pf=0, count=0, rs[25], m[10], n;
    clrscr();
    printf("\n Enter the length of reference string -- ");
    scanf("%d",&n); printf("\n Enter the reference string -- ");
    for(i=0;i<n;i++)
        scanf("%d",&rs[i]);
    printf("\n Enter no. of frames -- ");
    scanf("%d",&f);
    for(i=0;i<f;i++)
```

```

m[i]=-1;
printf("\n The Page Replacement Process is -- \n");
for(i=0;i<n;i++)
{
for(k=0;k<f;k++)
{
if(m[k]==rs[i]) break;
}
if(k==f)
{
m[count++]=rs[i];
pf++;
}
for(j=0;j<f;j++)
printf("\t%d",m[j]);
if(k==f)
printf("\tPF No. %d",pf); printf("\n");
if(count==f)
count=0;
}
printf("\n The number of Page Faults using FIFO are %d",pf);
getch();
}

```

OUTPUT

```

The Page Replacement Process is --
7  -1  -1  PF No. 1
7  0  -1  PF No. 2
7  0  1  PF No. 3

1   0   7
1   0   7
```

The number of page faults using LRU are 12

Program 10

Implement the following Disk Scheduling Algorithms:

a) SSTF Scheduling b) SCAN Scheduling

A. SSTF Scheduling

SSTF stands for Shortest Time First which very uses full of learning about how the disk drive manages the data having the shortest seek time.

Algorithm:

1. Let Request array represents an array storing indexes of tracks that have been requested.
'head' is the position of disk head.
2. Find the positive distance of all tracks in the request array from head.
3. Find a track from requested array which has not been accessed/serviced yet and has minimum distance from head.
4. Increment the total seek count with this distance.
5. Currently serviced track position now becomes the new head position.
6. Go to step 2 until all tracks in request array have not been serviced.

```
#include<stdio.h>
#include<conio.h>
#include<math.h>
int main()
{
int queue[100],t[100],head,seek=0,n,i,j,temp;
float avg;
// clrscr();
printf("*** SSTF Disk Scheduling Algorithm ***\n");
printf("Enter the size of Queue\t");
scanf("%d",&n);
printf("Enter the Queue\t");
for(i=0;i<n;i++)
{
scanf("%d",&queue[i]);
```

```

}
printf("Enter the initial head position\t");
scanf("%d",&head);
for(i=1;i<n;i++)
t[i]=abs(head-queue[i]);
for(i=0;i<n;i++)
{
for(j=i+1;j<n;j++)
{
if(t[i]>t[j])
{
temp=t[i];
t[i]=t[j];
t[j]=temp;
temp=queue[i];
queue[i]=queue[j];
queue[j]=temp;
}
}
}
for(i=1;i<n-1;i++)
{
seek=seek+abs(head-queue[i]);
head=queue[i];
}
printf("\nTotal Seek Time is%d\t",seek);
avg=seek/(float)n;
printf("\nAverage Seek Time is %f\t",avg);
return 0;
}

```

OUTPUT:

*** SSTF Disk Scheduling Algorithm ***

Enter the size of Queue 5

Enter the Queue 10 17 2 15 4

Enter the initial head position 3

Total Seek Time is14

Average Seek Time is 2.800000

RESULT:

Thus the program was executed and verified successfully.

B. SCAN Scheduling

SCAN DISK SCHEDULING ALGORITHM

```
#include<stdio.h>

main()
{
    int t[20], d[20], h, i, j, n, temp, k, atr[20], tot, p, sum=0;
    clrscr();
    printf("enter the no of tracks to be traveresed");
    scanf("%d",&n);
    printf("enter the position of head");
    scanf("%d",&h);
    t[0]=0;t[1]=h;
    printf("enter the tracks");
    for(i=2;i<n+2;i++)
        scanf("%d",&t[i]);
    for(i=0;i<n+2;i++)
    {
        for(j=0;j<(n+2)-i-1;j++)
        {
            if(t[j]>t[j+1])
            {
                temp=t[j];
                t[j]=t[j+1];
                t[j+1]=temp;
            }
        }
    }
}
```

```

    }
    for(i=0;i<n+2;i++)
        if(t[i]==h)
            j=i;
            k=i;
            p=0;
            while(t[j]!=0)
            {
                atr[p]=t[j];
                j--;
                p++;
            }
            atr[p]=t[j];
            for(p=k+1;p<n+2;p++,k++)
                atr[p]=t[k+1];
            for(j=0;j<n+1;j++)
            {
                if(atr[j]>atr[j+1])
                    d[j]=atr[j]-atr[j+1];
                else
                    d[j]=atr[j+1]-atr[j];
                sum+=d[j];
            }
            printf("\nAverage header movements:%f", (float)sum/n);
            getch();
    }

```

55	3
18	37

Program 11:**Implement the following File Allocation Strategies****a) Sequential b) Indexed**

OBJECTIVE Write a C program to simulate the following file allocation strategies.

a) Sequential b) Indexed

DESCRIPTION A file is a collection of data, usually stored on disk. As a logical entity, a file enables to divide data into meaningful groups. As a physical entity, a file should be considered in terms of its organization. The term "file organization" refers to the way in which data is stored in a file and, consequently, the method(s) by which it can be accessed.

SEQUENTIAL FILE ALLOCATION In this file organization, the records of the file are stored one after another both physically and logically. That is, record with sequence number 16 is located just after the 15th record. A record of a sequential file can only be accessed by reading all the previous records.

INDEXED FILE ALLOCATION Indexed file allocation strategy brings all the pointers together into one location: an index block. Each file has its own index block, which is an array of disk-block addresses. The i^{th} entry in the index block points to the i^{th} block of the file. The directory contains the address of the index block. To find and read the i^{th} block, the pointer in the i^{th} index-block entry is used.

A. SEQUENTIAL FILE ALLOCATION

```
#include<stdio.h>
#include<conio.h>
struct fileTable
{
char name[20];
int sb, nob;
}ft[30];
```

```

void main()
{
int i, j, n;
char s[20];
clrscr();
printf("Enter no of files :");
scanf("%d",&n);
for(i=0;i<n;i++)
{
printf("\nEnter file name %d :",i+1);
scanf("%s",ft[i].name);
printf("Enter starting block of file %d :",i+1);
scanf("%d",&ft[i].sb);
printf("Enter no of blocks in file %d :",i+1);
scanf("%d",&ft[i].nob);
}
printf("\nEnter the file name to be searched -- ");
scanf("%s",s);
for(i=0;i<n;i++)
if(strcmp(s, ft[i].name)==0)
break;
if(i==n)
printf("\nFile Not Found");
else
{
printf("\nFILE NAME START BLOCK NO OF BLOCKS BLOCKS OCCUPIED\n");
printf("\n%s\t\t%d\t\t%d\t\t",ft[i].name,ft[i].sb,ft[i].nob);
for(j=0;j<ft[i].nob;j++)
printf("%d, ",ft[i].sb+j);
}
getch();
}

```
